BIOS - Basic Input Output System

BIOS (Basic Input Output System) is a firmware that initializes and tests the hardware components of a computer system during the boot process. It is typically stored in a non-volatile memory chip on the motherboard. The BIOS is responsible for loading the operating system (OS) and providing a basic interface for the user to interact with the hardware. Common BIOS settings include the boot order, system clock, and hardware configuration. The BIOS is often accessed by pressing a key (e.g., F2, F10, F12, ESC) during the boot process. The BIOS is also responsible for the POST (Power-On Self-Test) routine, which checks the hardware for errors before the OS is loaded. The BIOS is a critical component of a computer system, and its settings can significantly affect the system's performance and stability.
