Fermentation - Wikipedia

Fermentation is a type of anaerobic metabolism that harnesses the redox potential of the reactants to make adenosine triphosphate (ATP) and organic end products. [1][2] Organic molecules, such as glucose or other sugars, are catabolized and their electrons are transferred to other organic molecules (cofactors, coenzymes, etc.). [1] .

What Is Fermentation? Definition and Examples - Science Notes and Projects

Fermentation is an anaerobic (oxygen-free) energy-generating process. It converts carbohydrates into energy, alcohol, acids, or gases. Common fermentation products include ethanol, lactic acid, and carbon dioxide. It occurs in yeast, bacteria, and animal cells (e.g., muscle cells).

Fermentation | Definition, Process, & Facts | Britannica

Fermentation, chemical process by which molecules such as glucose are broken down anaerobically. More broadly, fermentation is the foaming that occurs during the production of wine and beer, a process at least 10,000 years old.

Fermentation: Meaning, Process, Types and Importance

Fermentation is a metabolic process where microorganisms like yeast and bacteria convert sugars into alcohol, gases, or acids. Understanding the fermentation process and fermentation products is essential for applications in food production, biotechnology, and biofuel industries.

Fermentation: Process, Types, & Foods Explained

Learn about fermentation, its types (alcoholic & lactic acid), the process, and examples like cheese, beer, and kimchi. Discover how fermentation works and its role in food production and beyond.

Fermenting - National Center for Home Food Preservation

Fermentation is a process that involves the transformation of raw ingredients into a wide array of flavorful, preserved, and often nutritionally enhanced products.

Fermentation: How Microorganisms Make Food and Drink

Fermentation is fundamentally a metabolic process in which microorganisms convert carbohydrates, particularly sugars, into energy and various byproducts including alcohol, lactic acid, carbon dioxide, and other organic compounds.

The Science of Fermented Foods | Nutrition - Stanford Medicine

Fermentation happens when microbes—like bacteria and yeast—break down food components, creating new flavors and beneficial compounds. Unlike the strict biochemical definition, food fermentation can happen with or without oxygen.

Fermentation - Microbe Scholar

Fermentation is a process used by cells to generate energy where a suitable substrate is metabolized to make ATP by Substrate Level Phosphorylation (SLP).

Fermentation - Definition, Types, Process, & Equation

Fermentation is a biochemical process in which carbohydrates like glucose or starch are converted to alcohol or acid without oxygen. Microorganisms like yeasts, anaerobic bacteria, and muscle cells in animals use fermentation as a means of producing ATP without the presence of oxygen.
