insulin resistance (IR) and type 2 diabetes mellitus (T2DM) are closely related conditions. IR is a metabolic state characterized by a reduced sensitivity of tissues to insulin, leading to elevated blood glucose levels. T2DM is a chronic disease characterized by high blood glucose levels, often accompanied by complications such as cardiovascular disease, kidney disease, and nerve damage. The relationship between IR and T2DM is complex, involving genetic, environmental, and lifestyle factors. In this article, we will discuss the pathophysiology of IR and T2DM, the clinical presentation and management of T2DM, and the prevention and treatment of IR and T2DM.
