Understanding The Modulus Operator - Stack Overflow

The modulo operation returns the remainder or signed remainder of a division, after one number is divided by another, the latter being called the modulus of the operation. (source: wikipedia)

How to calculate a Modulo? - Mathematics Stack Exchange

16 I really can't get my head around this "modulo" thing. Can someone show me a general step-by-step procedure on how I would be able to find out the 5 modulo 10, or 10 modulo 5. Also, what does this mean: $1/17 = 113 \text{ modulo } 120$? Because when I calculate (using a calculator) $113 \text{ modulo } 120$, the result is 113. But what is the $1/17$ standing for then?

How does the % operator (modulo, remainder) work?

Let's say that I need to format the output of an array to display a fixed number of elements per line. How do I go about doing that using modulo operation? Using C++, the code below works for displ...

What is the difference between Modulus, Absolute value and Modulo?

The answer to "what is the difference" is "there isn't even a single similarity." Modulus is a term used for absolute value in complex analysis, and also a term used for the thing-being-divided-by in remainder arithmetic (actually called modular arithmetic). This latter usage extends far beyond in abstract algebra - when we speak of something modulo I , or speak of "modding out" by things, we ...

How Does Modulus Divison Work - Stack Overflow

Maybe the example with an clock could help you understand the modulo. A familiar use of modular arithmetic is its use in the 12-hour clock, in which the day is divided into two 12 hour periods.

How does a modulo operation work when the first number is smaller ...

I'm messing with the modulo operation in python and I understand that it will spit back what the remainder is. But what if the first number is smaller than the second? for instance $2 \% 5$ the an...

Understanding the result of modulo operator: - Stack Overflow

How to make sense of modulo in c - Stack Overflow

The modulo operator in C will give the remainder that is left over when one number is divided by another. For example, $23 \% 4$ will result in 3 since 23 is not evenly divisible by 4, and a remainder of 3 is left over.
