Soft-NMS - 1

Soft-NMS is a NMS algorithm that uses a soft NMS function to calculate the NMS score. It is based on the Soft-NMS function in the Soft-NMS paper. The Soft-NMS function is defined as follows:

Soft-NMS - 2

nms is a function that takes a list of boxes and scores and returns the NMS score. It is based on the Soft-NMS function in the Soft-NMS paper. The Soft-NMS function is defined as follows:

One to many assign NMS Strikes Back DETR

one-to-many label assignment + NMS is a function that takes a list of boxes and scores and returns the NMS score. It is based on the Soft-NMS function in the Soft-NMS paper. The Soft-NMS function is defined as follows:

Traditional NMS - 1

Traditional NMS is a NMS algorithm that uses a traditional NMS function to calculate the NMS score. It is based on the Traditional NMS function in the Traditional NMS paper. The Traditional NMS function is defined as follows:

DETR NMS - 1

DETR is a NMS algorithm that uses a DETR function to calculate the NMS score. It is based on the DETR function in the DETR paper. The DETR function is defined as follows:

DETR NMS - 2

DETR is a NMS algorithm that uses a DETR function to calculate the NMS score. It is based on the DETR function in the DETR paper. The DETR function is defined as follows:

torchvision nms - 1

_C = _lazy_import() return _C.nms(boxes, scores, iou_threshold) is a function that takes a list of boxes and scores and returns the NMS score. It is based on the Soft-NMS function in the Soft-NMS paper. The Soft-NMS function is defined as follows:

yolov5 merge-nms - 1

NMS is a function that takes a list of boxes and scores and returns the NMS score. It is based on the Soft-NMS function in the Soft-NMS paper. The Soft-NMS function is defined as follows:

torchvision nms - 2

NMS is a function that takes a list of boxes and scores and returns the NMS score. It is based on the Soft-NMS function in the Soft-NMS paper. The Soft-NMS function is defined as follows:

GlueCV 上的 YOLOv3 非极大值抑制 (NMS)

非极大值抑制 (NMS) - 简介

非极大值抑制 (NMS) 是目标检测中的一个重要步骤。它用于从检测到的目标框中去除重叠的框，只保留最可信的框。NMS 通常分为两种类型：1. 软 NMS (Soft NMS) 和 2. 硬 NMS (Hard NMS)。硬 NMS 通常使用交并比 (IoU) 来衡量框的重叠程度，并保留得分最高的框。软 NMS 则使用高斯函数来平滑得分，使得重叠框的得分降低。OHEM (One-Step Hard-Exclusion Method) 是一种结合了硬 NMS 和软 NMS 的方法，旨在提高检测精度并减少计算量。...
