Explain the formation of {O}_2 molecule using molecular orbital theory.

O₂: $KK(\sigma_{2s})^2(\sigma_{2s}^*)^2(\pi_{2px})^2 = (\pi_{2py})^2(\pi_{2px})^1 = (\pi_{2py}^*)^1$ The molecular orbital energy level diagram of oxygen molecule is given as follows : Bond order $N_b - N_a / 2 = 8 - 4 / 2 = 2$ Thus, oxygen molecule has two bonds. i.e., one is bond and one p bond. The last two electrons in π^*_{2px} and π^*_{2py} orbitals will remain unpaired.
