Titration - Wikipedia

A burette and Erlenmeyer flask (conical flask) being used for an acid-base titration. Titration (also known as titrimetry^[1] and volumetric analysis) is a common laboratory method of quantitative chemical analysis to determine the concentration of an identified analyte (a substance to be analyzed).

Titration - Definition, Types, Procedure, and Applications

Learn what titration is, how it works, types of titration, how to find the endpoint, and how to calculate unknown concentrations.

Titration | Definition, Types, & Facts | Britannica

Titration, process of chemical analysis in which the quantity of some constituent of a sample is determined by the gradual addition to the measured sample of an exactly known quantity of another substance with which the desired constituent reacts in a definite, known proportion.

Titration: Definition, Curve, Formula, and Types

Titration involves the gradual addition of a reagent of known concentration, known as the titrant, to a solution whose concentration needs to be determined, known as the analyte.

Titration Explained: Definition, Types, and Step-by-Step Procedure

Titration is a key analytical technique used in chemistry to determine the concentration of an unknown solution using a solution of known concentration. This article will explain what titration is, explore its main types, and walk you through a complete titration procedure with examples and tips.

Titration - Chemistry LibreTexts

Titration is the slow addition of one solution of a known concentration (called a titrant) to a known volume of another solution of unknown concentration until the reaction reaches neutralization, ...

Understanding Titrations: How Chemical Reactions Work

What is Titration? Titration is a technique where a solution of known concentration (the titrant) is gradually added to a solution of unknown concentration until a reaction is complete.

Titration Explained | A Comprehensive Guide to Chemical Analysis

Titration is a well-established analytical technique: Titration is one of the oldest and most commonly used quantitative analytical methods. Manual, semi-automated, and fully automated titrations have been extensively developed and are employed in a wide range of industries.

What is titration in chemistry? - California Learning Resource Network

Titration, a cornerstone of quantitative chemical analysis, is a technique employed to determine the concentration of an analyte (a substance of interest) by reacting it with a titrant (a standard solution of known concentration).

Titrations in Chemistry Lab - The Physics Classroom

How to Perform a Titration A titration is a precise analytical procedure that requires attention to numerous details. The following step-by-step procedure describes some of those details. Clean all glassware - flasks, beakers, burette, funnels, stirring rod, etc. - with deionized water.
