TypeError - JavaScript | MDN

The TypeError object represents an error when an operation could not be performed, typically (but not exclusively) when a value is not of the expected type.

Handling TypeError Exception in Python - GeeksforGeeks

In Python, a TypeError occurs when an operation or function is applied to an object of an inappropriate type, such as adding a string and an integer. Although Python is dynamically typed, it still expects compatible data types for operations like arithmetic, indexing, iteration and function calls.

I'm getting a TypeError. How do I fix it? - Stack Overflow

A valid, non-duplicate question about a TypeError will ask why a specific, minimal, reproducible example causes a TypeError, and explain what you expected to happen instead and why.

TypeError | Python's Built-in Exceptions - Real Python

TypeError is a built-in exception that occurs when an operation is applied to an object of inappropriate type. For example, trying to add a string to an integer will raise a TypeError because these types implement addition in different and incompatible ways.

TypeError in Python - PythonForBeginners.com

TypeError is an exception in Python programming language that occurs when the data type of objects in an operation is inappropriate. For example, If you attempt to divide an integer with a string, the data types of the integer and the string object will not be compatible.

Python TypeError Exception - W3Schools

The TypeError exception occurs if an operation tries to perform an action with an unexpected data type. You can handle the TypeError in a try...except statement, see the example below.

8. Errors and Exceptions — Python 3.14.2 documentation

Exceptions come in different types, and the type is printed as part of the message: the types in the example are ZeroDivisionError, NameError and TypeError. The string printed as the exception type is the name of the built-in exception that occurred.

TypeError - JavaScript Documentation

A TypeError may be thrown when: an operand or argument passed to a function is incompatible with the type expected by that operator or function; or when attempting to modify a value that cannot be changed; or when attempting to use a value in an inappropriate way.

Understanding `TypeError` in Python - CodeRivers

In the world of Python programming, TypeError is one of the most common exceptions that developers encounter. It occurs when a function or operation is applied to a value of an inappropriate data type. Understanding TypeError is crucial for debugging code and writing robust Python applications.

Error Encyclopedia | Type Error - Carleton

A TypeError occurs in Python when you attempt to call a function or use an operator on something of the incorrect type. For example, let's see what happens when we try and add together two incompatible types:
