Wool - Wikipedia

Wool is an animal fiber and consists of protein together with a small percentage of lipids. This makes it chemically quite distinct from cotton and other plant fibers, which are mainly cellulose, and akin to silk, another animal fiber composed primarily of protein.

Wool | Animal Fibre, Textile & Clothing Uses | Britannica

Wool, animal fibre forming the protective covering, or fleece, of sheep or of other hairy mammals, such as goats and camels. Prehistoric man, clothing himself with sheepskins, eventually learned to make yarn and fabric from their fibre covering.

What Is Wool? | Garnet Hill

Wool is versatile, absorbent, temperature regulating, moisture wicking, and water resistant. This natural fiber's rich history spans thousands of years, a heritage that lends a timeless quality to clothing, bedding, rugs, and décor made from wool.
